### RELEASE DATE:

29 July 2024 at 11:30 am

## **Zoundream integrates Babbly's technology, starting a new era of infant care**

Zoundream, the global leader in AI-driven infant cry analysis, is thrilled to announce the integration of Babbly's pioneering technology for speech development monitoring. This strategic acquisition represents a monumental advancement for Zoundream in the field of infant monitoring.

Babbly, a Canadian startup headquartered in Toronto, developed the world's most advanced AI technology for analyzing infant speech and language development. This solution, developed through years of rigorous scientific and clinical research, will complement Zoundream's expertise in monitoring infant needs and development through non-invasive analysis of cry sounds.

By integrating Babbly's technology, Zoundream further reinforces its unique position, becoming the only company worldwide capable of analyzing the full range of early infant communication, from the earliest baby cries to the first babbles and words of the toddler. This integration strengthens the company as the leading provider in this space, and offers parents and caregivers the most comprehensive technology to support their infants' developmental journey—all in one unique platform.

## **About Zoundream**

Zoundream is a health-tech startup based in Basel, Switzerland, with its engineering center in Barcelona, Spain. The company was started to help parents better understand and address their babies' needs, by developing solutions for continuous, non-invasive, home monitoring of infants' health - from translating the meaning of baby cries to early detection of potential neurodevelopmental disorders and pathologies. The company is teaming up with the very best baby and home consumer companies globally.
